This nav bar will actually have a search bar in it, but I couldn't figure out how to do that in basalmiq. When the user types in a phrase, it goes to `"/results"`

`"browse saved terms"` goes to `"/browse_terms"`

Recent translations will show user's most recent translations, most recent first. They will be linked to `"/view_term"` so user can see what notes they made, edit, or delete.

After user types in phrase and hits Translate, app makes an API call to libretranslate and pops open a prepopulated form with the english phrase, the french phrase, a place for notes, and the ability to save. After saving, the user is redirected to this page.

"new\_term" also "/term/<id>"

This page will show some limited number of terms per first letter (maybe 10?)  
Clicking on the big first letter takes user to a page of all phrases starting with that letter.  
Clicking on the phrase takes user to 'view\_term/id' route

All-purpose search results page, for searching by phrase or first letter
